consumption

Insights recap

- **Alcohol Consumption and Grades:** Both daily (Dalc) and weekend (Walc) alcohol consumption appear to have some relationship with G1 grades. The box plots suggest that as alcohol consumption levels increase, the median G1 grade might tend to decrease, although this trend might not be strictly linear or strong.
- **Parental Education and Grades:** There appears to be a positive correlation between the average parental education level and the G1 grade. The bar chart suggests that students with higher average parental education levels tend to have higher average G1 grades.
- **Study Time and Grades:** The bar chart indicates a positive trend between study time and G1 grades. Students who report spending more time studying generally have higher average G1 grades.
- **Absences and Grades:** The scatter plot with the trend line suggests a potential negative relationship between the number of absences and G1 grades. As the number of absences increases, the G1 grade might tend to decrease, although the trend line shows the general tendency and individual data points may vary.
- **Age and Alcohol Consumption:** The bar chart showing average daily and weekly alcohol consumption by age provides insights into how alcohol consumption patterns might differ across age groups in this dataset.
